

Fingertip Mouse Corporation d/b/a FTM Computer Products v. Samsung Electronics America, Inc.

Likely expert questions include whether the accused Samsung product is a tracking device that receives part of a finger; whether it interacts with a base in the claimed relationship; what sensor, optical, inertial, touch, firmware, radio, and host-interface functions it uses; how physical motion becomes cursor movement; and what a person of ordinary skill would have understood from the 2004 priority-era input-device art.

Independent preliminary research based on public information.

FORUM / DOCKET	U.S. District Court for the Eastern District of Texas / 2:26-cv-00760
FILED / TYPE	2026-08-26 / patent infringement
PUBLIC DOCKET	Open docket

VERIFIED PUBLIC RECORD

The public CourtListener docket and complaint identify Fingertip Mouse Corporation d/b/a FTM Computer Products v. Samsung Electronics America, Inc., Civil Action No. 2:26-cv-00760, in the Eastern District of Texas, filed August 26, 2026. The complaint asserts U.S. Patent Nos. 9,092,075, 9,261,983, and 10,963,070, each titled 'Fingertip Mouse and Base,' and alleges that Samsung Galaxy Ring products infringe at least claim 1 of each. These are allegations, not findings.

LIKELY RESEARCH PURCHASER

Cortney S. Alexander - Patent-litigation attorney, Kent & Risley LLC. Verified complaint fact and analytical inference: the August 26, 2026 complaint signature block identifies Alexander as counsel for Fingertip Mouse and prints his exact professional email. That makes him a plausible initial recipient for preliminary expert-search research; it does not establish purchasing authority.

cortneyalexander@kentrisley.com - publicly printed in the [linked professional source](#); not inferred.

TECHNICAL FRAME

Likely expert questions include whether the accused Samsung product is a tracking device that receives part of a finger; whether it interacts with a base in the claimed relationship; what sensor, optical, inertial, touch, firmware, radio, and host-interface functions it uses; how physical motion becomes cursor movement; and what a person of ordinary skill would have understood from the 2004 priority-era input-device art.

Secondary-source limitation: This is an issue map derived from the publicly available patent-family descriptions, not a representation of Samsung's accused product or the allegations in the unavailable complaint. The complaint, asserted-claim list, accused-product identification, product samples, source code, firmware, teardown material, and discovery must be reviewed before reaching any technical conclusion. [Open public synopsis](#)

REPORTED ASSERTED PATENTS

[U.S. Patent No. 10,963,070](#) | [U.S. Patent No. 9,261,983](#) | [U.S. Patent No. 9,092,075](#)

Questions likely to require expert input

This issue map is a research plan, not a legal conclusion. The filed complaint, patent exhibits, intrinsic record, and discovery must control.

01 Finger-received tracking device

Does the accused product receive at least part of a user's finger and operate as a tracking device in the sense required by each asserted claim?

Potential evidence: Accused-product samples, mechanical drawings, user manuals, teardown photographs, CAD, claim construction, and controlled-use testing.

02 Base and tracker relationship

Is there a separate base device that receives the tracker, and does the relevant movement occur relative to an adjacent surface as claimed?

Potential evidence: Product samples, docking and charging documentation, assembly drawings, firmware logs, device demonstrations, and engineering specifications.

03 Motion sensing and cursor translation

What sensors capture movement and how do firmware and host drivers translate that information into pointer or GUI-object movement?

Potential evidence: Sensor datasheets, embedded source code, firmware binaries, driver source, HID reports, host logs, and protocol traces.

04 Input controls and ergonomics

How do switches, gestures, touch surfaces, and physical placement implement selection, scrolling, and other mouse functions, and are those functions technically relevant to the asserted claims?

Potential evidence: User-interface specifications, industrial-design records, usability studies, manuals, demonstrations, and test protocols.

Questions likely to require expert input

05 Wireless and host communications

How does the device communicate with the host, and what parts of the tracking, button processing, pairing, and cursor-control path reside in hardware, firmware, or host software?

Potential evidence: Bluetooth or proprietary-radio specifications, USB/HID captures, firmware, host drivers, pairing logs, and network architecture.

06 Claim attribution and component boundaries

Which entity and component performs each claimed function: the device, dock/base, phone or computer, operating system, driver, application, or a third-party chip and software supplier?

Potential evidence: Bill of materials, supplier specifications, source repositories, technical design documents, APIs, deployment records, and testimony.

07 Priority-era baseline and validity

What did a person of ordinary skill understand in the 2004 priority era about finger-worn pointing devices, optical or inertial tracking, docking, wireless mice, and GUI cursor control?

Potential evidence: Contemporaneous patents, product manuals, standards, academic literature, engineering texts, and supported POSITA analysis.

Candidates 1-2 for further diligence

Ranked for preliminary research priority based on subject-matter fit, relevant public work, testimony, and visible diligence burden. This is not a retention recommendation.

01 Chris Harrison, PhD

Professor of Human-Computer Interaction, Carnegie Mellon University; director, Future Interfaces Group

TECHNICAL FIT

Direct fit for new sensing and interface technologies, wearable computing, embedded sensing, physical fabrication, and human-device interaction.

RELEVANT WORK

His public profile describes research on sensing and interface technologies for wearable computing, augmented reality, embedded computation, computer vision, signal processing, interaction design, and physical fabrication.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

An academic interface-and-sensing profile may need to be paired with a product teardown or HID/firmware specialist if the dispute turns on particular Samsung implementation details.

[Source 1](#) | [Source 2](#)

[Draft email](#) | chris.harrison@cs.cmu.edu | [public email source](#)

02 Christian Holz, PhD

Associate Professor, Department of Computer Science, ETH Zurich; lead, Sensing, Interaction & Perception Lab

TECHNICAL FIT

Strong fit for input decoding, interaction sensing, mixed-reality interfaces, perception, and hardware/software boundaries in interactive devices.

RELEVANT WORK

ETH identifies Holz as an associate professor; his public lab description focuses on input decoding and interaction, and reports a prior Microsoft Research principal-researcher role.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

The match is strongest for sensing and interaction design rather than a particular commercial mouse chipset or operating-system stack; prior relationships require diligence.

[Source 1](#) | [Source 2](#)

[Draft email](#) | christian.holz@inf.ethz.ch | [public email source](#)

Candidates 3-4 for further diligence

03 Patrick Baudisch, PhD

Professor and head of Human Computer Interaction, Hasso Plattner Institute

TECHNICAL FIT

Strong fit for physical interactive devices, haptics, physical virtual reality, device fabrication, and interaction between a user's body and a pointing device.

RELEVANT WORK

HPI states that Baudisch leads its HCI group, which designs and implements interactive devices and systems, including haptics, physical virtual reality, and fabrication technologies.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

The technical focus is broad physical HCI; engagement scope should distinguish product ergonomics and sensing from any patent-family-specific software or damages question.

[Source 1](#) | [Source 2](#)

[Draft email](#) | patrick.baudisch@hpi.de | [public email source](#)

04 Antti Oulasvirta, PhD

Professor, Department of Information and Communications Engineering, Aalto University; leader, User Interfaces research group

TECHNICAL FIT

Strong fit for user interfaces, human factors, user performance, computational interface design, and device-interaction evaluation.

RELEVANT WORK

Aalto lists expertise in human-computer interaction, user interfaces, human factors, human performance, interactive AI, computational design, and cognitive modeling, plus a substantial publication record in interface research.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

His fit is most direct for interface behavior and human factors; a separate embedded-systems or optical-sensor expert may be required for detailed hardware infringement analysis.

[Source 1](#)

[Draft email](#) | antti.oulasvirta@aalto.fi | [public email source](#)

Candidates 5-6 for further diligence

05 Jacob O. Wobbrock, PhD

Adjunct, University of Washington Information School

TECHNICAL FIT

Strong fit for human-centered computing, interaction with the physical world, accessibility, and empirical evaluation of pointing and input techniques.

RELEVANT WORK

The University of Washington identifies Wobbrock's focus area as human-centered computing and interaction with the physical world, with expertise in accessibility and human-computer interaction.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Public material emphasizes HCI and accessibility rather than an identified commercial pointing-device implementation; engagement scope and relationships need diligence.

[Source 1](#)

[Draft email](#) | wobbrock@uw.edu | [public email source](#)

06 Karon E. MacLean, PhD

Professor, Department of Computer Science, University of British Columbia

TECHNICAL FIT

Strong fit for haptics, multisensory interaction, physical input design, and evaluation of user-facing feedback in interactive hardware.

RELEVANT WORK

A peer-reviewed IEEE publication identifies MacLean as a UBC Computer Science author and describes her work in haptic design and multisensory interactive systems.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Haptics may be peripheral if the asserted claims focus only on tracking and base geometry; current role, industry ties, and litigation history require refresh before retention.

[Source 1](#)

[Draft email](#) | kmaclean@cs.ubc.ca | [public email source](#)

Candidates 7-8 for further diligence

07 Kasper Hornbæk, PhD

Professor, Department of Computer Science, University of Copenhagen

TECHNICAL FIT

Strong fit for HCI methodology, user experience, shape-changing interfaces, body-based interaction, and rigorous usability or human-performance evaluation.

RELEVANT WORK

The University of Copenhagen identifies Hornbæk as a professor in Human-Centred Computing; public work describes research on user experience, body-based interaction, interface design, and usability measurement.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

His principal contribution would likely be interface evaluation and human factors rather than reverse engineering an accused electronic product.

[Source 1](#) | [Source 2](#)

[Draft email](#) | kash@di.ku.dk | [public email source](#)

08 Yvonne Rogers, PhD

Professor and Director, UCL Interaction Centre

TECHNICAL FIT

Strong fit for human-centered computing, interactive-system design, and explaining the design and use implications of an input-device architecture.

RELEVANT WORK

UCL lists Rogers as Professor and Director of UCLIC, with research areas including cognitive and computational psychology, design, AI, and human-centred computing.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Her public profile is broad HCI rather than a particular pointing-sensor architecture; retain only if user-focused design questions are material.

[Source 1](#)

[Draft email](#) | y.rogers@ucl.ac.uk | [public email source](#)

Candidates 9-10 for further diligence

09 Jeffrey P. Bigham, PhD

Associate Professor, Carnegie Mellon University Human-Computer Interaction Institute

TECHNICAL FIT

Strong fit for human-centered AI, accessibility, assistive technology, AR/VR/XR, and interaction tools—useful if the matter turns on how a finger-received device enables or improves user control.

RELEVANT WORK

CMU identifies Bigham as an associate professor in its HCI Institute, lists research areas in human-centered AI, accessibility, assistive technology, AR/VR/XR, and tools, and his CV records a UIST Best Paper Award and work on accessible interaction technology.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

The technical overlap is less direct if only mechanical tracking and dock architecture are disputed; an input-device engineer may rank above him after claim review.

[Source 1](#) | [Source 2](#)

[Draft email](#) | jbigham@cs.cmu.edu | [public email source](#)

10 Paul Dourish, PhD

Chancellor's Professor and Steckler Endowed Chair of Information and Computer Science, University of California, Irvine

TECHNICAL FIT

Potential fit for embodied interaction, ubiquitous computing, tangible interfaces, and the human-system interaction model relevant to a physical pointing device.

RELEVANT WORK

UCI identifies Dourish as a Chancellor's Professor with research interests in ubiquitous computing, embodied interaction, human-computer interaction, and computer-supported cooperative work; it lists ACM Fellow and SIGCHI Academy recognition.

PUBLIC LITIGATION EXPERIENCE

No public testifying role was located in this preliminary bounded review; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

The match is conceptual HCI rather than component-level sensor, firmware, or product-engineering analysis; scope must be limited accordingly.

[Draft email](#) | jjpd@ics.uci.edu | [public email source](#)

Preliminary candidates; no conflicts or availability determination

- Run party, affiliate, counsel, inventor, funder, and technology conflicts.
- Confirm testimony history, exclusions, compensation, publications, patents, and deposition performance.
- Investigate licensing, grants, consulting, commercial interests, and prior technical positions.
- Confirm role fit, availability, and interest only after counsel authorizes outreach.

ONGOING MATTER-SPECIFIC RESEARCH

Flint Witness Research works in the post-filing window, turning pleadings and public technical records into issue maps, researched candidate slates, and diligence starting points as the case develops.

LIMITATIONS

This is an issue map derived from the publicly available patent-family descriptions, not a representation of Samsung's accused product or the allegations in the unavailable complaint. The complaint, asserted-claim list, accused-product identification, product samples, source code, firmware, teardown material, and discovery must be reviewed before reaching any technical conclusion.

No attorney or expert was contacted. Availability, interest, compensation, and conflicts were not checked.
