

Daedalus Cloud v. Oracle

A public complaint synopsis identifies Oracle Cloud Infrastructure, NVIDIA BlueField DPUs, vector-processor storage offload, erasure encoding, and storage-latency hiding as the alleged technical center of the dispute.

Independent preliminary research based on public information.

Prepared 2026-08-25. No attorney or expert contacted. Availability, interest, compensation, and conflicts not checked.

Public filing, likely recipient, and technical frame

CAPTION

Daedalus Cloud LLC v. Oracle Corporation et al.

FORUM / DOCKET

U.S. District Court for the Eastern District of Virginia / 1:26-cv-02709

FILED / TYPE

2026-08-21 / patent infringement

PUBLIC DOCKET[Open docket](#)**VERIFIED PUBLIC RECORD**

The public docket identifies four patent exhibits attached to the complaint and Tara L. Zurawski as the sole listed plaintiff counsel and filer of the opening papers.

LIKELY RESEARCH PURCHASER

Tara L. Zurawski - Of Counsel, Bunsow De Mory LLP. Verified docket fact and analytical inference: she is the sole listed plaintiff counsel and filed the complaint and all opening papers, making her the most likely initial purchaser or internal sponsor of expert research.

tzurawski@bdiplaw.com - publicly listed on the [official firm biography](#); not inferred.

TECHNICAL FRAME

A public complaint synopsis identifies Oracle Cloud Infrastructure, NVIDIA BlueField DPUs, vector-processor storage offload, erasure encoding, and storage-latency hiding as the alleged technical center of the dispute.

Secondary-source limitation: This is secondary-source analysis. Every claim, quotation, and accused-product statement must be checked against the filed complaint and exhibits before publication. [Open public synopsis](#)

REPORTED ASSERTED PATENTS

[U.S. Patent No. 11,263,145](#) | [U.S. Patent No. 11,782,844](#) | [U.S. Patent No. 12,086,070](#) | [U.S. Patent No. 12,235,772](#)

Questions likely to require expert input

This issue map is a research plan, not a legal conclusion. The filed complaint, patent exhibits, intrinsic record, and discovery must control.

01 Meaning of vector processor

Would a person of ordinary skill understand an NVIDIA BlueField DPU, or the particular OCI component alleged, to satisfy the asserted claims' vector-processor limitations?

Potential evidence: Claim language, specification, prosecution history, DPU architecture materials, source code, hardware configuration, and expert architecture analysis.

02 Erasure-encoding relationship

Does the accused implementation generate and recover fragments using the claimed n , m , and k relationship, and where is that computation performed?

Potential evidence: Storage-service design documents, erasure-code implementation, configuration parameters, performance tests, and controlled reconstruction experiments.

03 Processor-to-storage control path

Does the alleged vector processor directly instruct storage devices as claimed, or do CPUs, host software, controllers, or intermediate services perform material steps?

Potential evidence: OCI architecture diagrams, BlueField firmware, driver paths, kernel traces, storage-controller documentation, and source code.

04 Latency hiding and concurrency

Do the accused systems perform the claimed overlapping or latency-hiding operations, and are any observed performance gains attributable to the claimed arrangement?

Potential evidence: Execution traces, queue and pipeline behavior, benchmarks, telemetry, timing analysis, and alternative architecture comparisons.

Questions likely to require expert input

05 Accused OCI services and versions

Which OCI Object Storage, File Storage, or other services and which BlueField generations actually use the accused data path during the damages period?

Potential evidence: Version histories, deployment records, bills of materials, regional configuration, service documentation, and engineering testimony.

06 Priority-date technical baseline

What did skilled artisans understand by August 2018 about GPU/DPU storage offload, erasure coding, direct storage access, and latency hiding?

Potential evidence: Contemporaneous papers, standards, open-source systems, product manuals, patents, and a defensible POSITA definition.

07 Noninfringing alternatives

Could Oracle have achieved comparable durability, throughput, and cost using CPU-based coding, different accelerators, or materially different control paths?

Potential evidence: Alternative designs, engineering cost and timing, benchmarks, feasibility records, and product-roadmap evidence.

08 Technical value and apportionment

What portion of any OCI storage value is technically attributable to the asserted features rather than other storage, networking, security, and orchestration functions?

Potential evidence: Feature usage, performance contribution, customer evidence, cost studies, comparable architectures, and technical nexus analysis.

Candidates 1-2 for further diligence

Ranked for preliminary research priority based on subject-matter fit, relevant public work, testimony, and visible diligence burden. This is not a retention recommendation.

01 James S. Plank, PhD

Professor, Min H. Kao Department of Electrical Engineering and Computer Science, University of Tennessee, Knoxville

TECHNICAL FIT

Direct specialist in erasure coding, fault-tolerant and distributed storage, Galois-field arithmetic, and practical coding libraries.

RELEVANT WORK

Creator or contributor to widely used erasure-coding software and publications including Jerasure, GF-Complete, Liberation Codes, and storage-focused erasure-code tutorials.

PUBLIC LITIGATION EXPERIENCE

Served as a storage-technology expert in EMC Corp. v. Pure Storage and as defendants' expert in ChampionX v. Resonance Systems.

POINTS FOR FURTHER DILIGENCE

Extensive prior expert work creates discoverable positions. A 2024 order discusses a prior StreamScale arbitration concerning alleged information disclosure; the matter settled without assigned blame but would require careful diligence.

[Source 1](#) | [Source 2](#) | [Source 3](#) | [Source 4](#)

[Draft email](#) | jplank@utk.edu | [public email source](#)

02 Gregory R. Ganger, PhD

Jatras Professor of Electrical and Computer Engineering, Carnegie Mellon University

TECHNICAL FIT

Cloud computing, distributed storage, operating systems, storage access control, and performance at large scale.

RELEVANT WORK

Leads research spanning cloud computing, resource scheduling, big-data systems, and distributed storage through CMU's Parallel Data Lab ecosystem.

PUBLIC LITIGATION EXPERIENCE

Public records identify expert reports or testimony in Sun Microsystems v. Network Appliance and 01 Communique matters.

POINTS FOR FURTHER DILIGENCE

Established expert history means prior claim-construction, infringement, and validity opinions should be mapped for consistency. Less narrowly focused on erasure-code mathematics than Plank.

[Source 1](#) | [Source 2](#) | [Source 3](#)

[Draft email](#) | ganger@ece.cmu.edu | [public email source](#)

Candidates 3-4 for further diligence

03 Erez Zadok, PhD

Professor of Computer Science and Director, File Systems and Storage Lab, Stony Brook University

TECHNICAL FIT

File systems, distributed and cloud storage, operating systems, performance, benchmarking, and storage reliability.

RELEVANT WORK

Directs Stony Brook's File Systems and Storage Lab and serves as Editor-in-Chief of ACM Transactions on Storage.

PUBLIC LITIGATION EXPERIENCE

Substantial district-court and PTAB experience; a public deposition states that he has represented plaintiffs and defendants, and public PTAB records include repeated declarations.

POINTS FOR FURTHER DILIGENCE

Frequent expert work and a substantial PTAB record create a large cross-examination corpus. Public aggregations suggest a defense/petitioner tilt, which must be verified from underlying matters.

[Source 1](#) | [Source 2](#) | [Source 3](#) | [Source 4](#)

[Draft email](#) | ezk@cs.stonybrook.edu | [public email source](#)

04 Tor M. Aamodt, PhD

Professor of Electrical and Computer Engineering, University of British Columbia

TECHNICAL FIT

GPU and accelerator architecture, memory systems, general-purpose parallel processing, and NVIDIA architecture history.

RELEVANT WORK

Co-author of a GPGPU architecture book; developed influential GPU simulation work; formerly worked at NVIDIA on GeForce 8 memory-system architecture, the first CUDA-capable generation.

PUBLIC LITIGATION EXPERIENCE

His official biography states patent-litigation work involving GPUs and computer systems; a public order discusses his expert report in XMTT v. Intel.

POINTS FOR FURTHER DILIGENCE

Stronger on GPU architecture than enterprise storage services or erasure-code implementation. Industry consulting and research funding, including NVIDIA and Huawei connections, require conflicts and bias diligence.

[Source 1](#) | [Source 2](#) | [Source 3](#)

[Draft email](#) | aamodt@ece.ubc.ca | [public email source](#)

Candidates 5-6 for further diligence

05 Randal Burns, PhD

Bill and Lisa Stromberg Department Head and Professor of Computer Science, Johns Hopkins University

TECHNICAL FIT

Scale-out cloud storage, redundancy coding, storage auditing, large data systems, and storage-area-network architecture.

RELEVANT WORK

Research spans storage-area networks, scientific services on scale-out cloud storage, redundancy coding, and data-intensive systems; previously worked at IBM Almaden.

PUBLIC LITIGATION EXPERIENCE

No clear public testifying role located in the initial bounded search; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Department-head duties may constrain time. Research emphasizes scientific data systems and storage services more than DPU microarchitecture. Availability and conflicts were not checked.

[Source 1](#)

[Draft email](#) | randal@cs.jhu.edu | [public email source](#)

06 Bianca Schroeder, PhD

Full Professor and Canada Research Chair in Data Centre Technologies, University of Toronto

TECHNICAL FIT

Large-scale systems, storage systems, data centers, failure behavior, and empirical systems reliability.

RELEVANT WORK

Research focuses on design and analysis of storage and data-center systems, including large-scale reliability and performance behavior.

PUBLIC LITIGATION EXPERIENCE

No clear public patent-litigation testimony located in the initial bounded search; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Best suited to reliability, performance, and data-center evidence; less directly matched to claim construction for vector processors or finite-field coding algorithms.

[Source 1](#)

[Draft email](#) | bianca@cs.toronto.edu | [public email source](#)

Candidates 7-8 for further diligence

07 Hakim Weatherspoon, PhD

Professor of Computer Science, Cornell University

TECHNICAL FIT

Secure and fault-tolerant distributed storage, internet-scale systems, reliability, security, and performance.

RELEVANT WORK

PhD work addressed distributed wide-area archival storage; current research covers decentralized and fault-tolerant systems at internet scale.

PUBLIC LITIGATION EXPERIENCE

No clear public testifying role located in the initial bounded search; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Broad distributed-systems profile rather than a narrow DPU or erasure-code implementation specialist. Academic and industry relationships require standard diligence.

[Source 1](#) | [Source 2](#)

[Draft email](#) | hweather@cs.cornell.edu | [public email source](#)

08 Haryadi S. Gunawi, PhD

Professor of Computer Science, University of Chicago

TECHNICAL FIT

Cloud and storage reliability, latency-tail behavior, performance stability, scalability bugs, and new storage technologies.

RELEVANT WORK

Leads the UCARE group on availability, reliability, and efficiency in storage and cloud systems; publications address limpware, tail latency, and dependable storage.

PUBLIC LITIGATION EXPERIENCE

No clear public testifying role located in the initial bounded search; this is not a representation that none exists.

POINTS FOR FURTHER DILIGENCE

Best fit for performance and reliability questions, not erasure-code mathematics or NVIDIA DPU design. Prior Google and NetApp research awards warrant routine relationship diligence.

[Source 1](#) | [Source 2](#)

[Draft email](#) | haryadi@cs.uchicago.edu | [public email source](#)

Candidates 9-10 for further diligence

09 Darrell D. E. Long, PhD

Distinguished Research Professor of Engineering, University of California, Santa Cruz

TECHNICAL FIT

Storage-system architecture, operating systems, distributed computing, archival storage, reliability, and security.

RELEVANT WORK

Longstanding leader in UCSC storage research with publications and patents concerning storage systems and high-rate data access.

PUBLIC LITIGATION EXPERIENCE

Extensive patent-expert history. A public 2013 deposition states roughly a dozen prior expert engagements; later records show additional PTAB and district-court work.

POINTS FOR FURTHER DILIGENCE

Large, predominantly defense/petitioner-side public record and earlier opinions in storage matters require issue-by-issue consistency review. Current distinguished-research role should be confirmed.

[Source 1](#) | [Source 2](#) | [Source 3](#)

[Draft email](#) | darrell@ucsc.edu | [public email source](#)

10 Ethan L. Miller, PhD

Professor Emeritus and Director Emeritus, Center for Research in Systems and Storage, University of California, Santa Cruz

TECHNICAL FIT

Storage reliability, archival storage, erasure coding, file systems, and storage-system performance.

RELEVANT WORK

Co-authored work on finite-field arithmetic for erasure coding and alpha-entanglement codes; longtime leader of UCSC storage research.

PUBLIC LITIGATION EXPERIENCE

No clear public testifying role attributable to this computer scientist was located in the initial bounded search; same-name results create false-positive risk.

POINTS FOR FURTHER DILIGENCE

Emeritus status and current activity must be confirmed. Same-name contamination is material in litigation-history searching; identity matching requires care.

Preliminary candidates; no conflicts or availability determination

- Run party, affiliate, counsel, inventor, funder, and technology conflicts.
- Confirm testimony history, exclusions, compensation, publications, patents, and deposition performance.
- Investigate licensing, grants, consulting, commercial interests, and prior technical positions.
- Confirm role fit, availability, and interest only after counsel authorizes outreach.

ONGOING MATTER-SPECIFIC RESEARCH

Flint Witness Research works in the post-filing window, turning pleadings and public technical records into issue maps, researched candidate slates, and diligence starting points as the case develops.
